# EarthCARE data processing

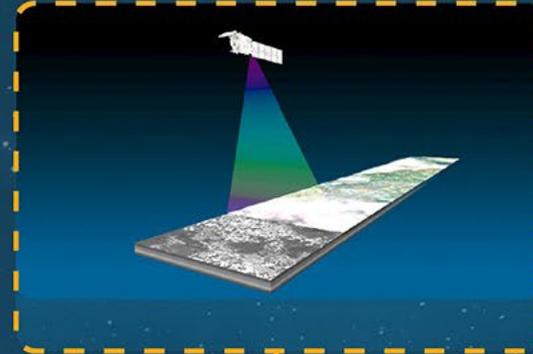

## Cloud Profiling Radar Level-1b (JAXA)

- Radar reflectivity
- Doppler velocity profiles

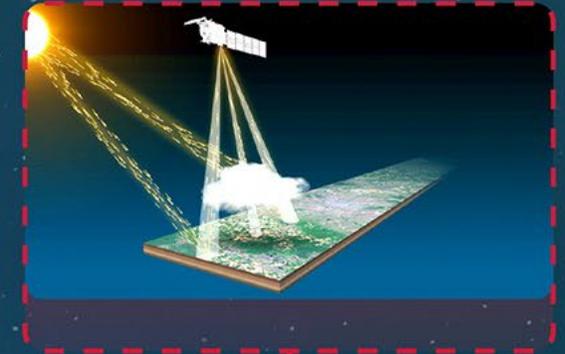

## Atmospheric Lidar Level-1b (ESA)

- Attenuated backscatter in
- Raleigh channel
  - Co-polar Mie channel
  - Cross-polar Mie channel

## Multispectral Imager Level-1b (ESA)

- Top-of-atmosphere radiances for solar channels
- Top-of-atmosphere brightness temperatures for thermal channels

## Broadband Radiometer Level-1b (ESA)

- Filtered top-of-atmosphere shortwave radiance
- Filtered top-of-atmosphere total wave radiance

# EarthCARE production models

- Paper describing ESA & JAXA science data processing chains:

[doi.org/10.5194/amt-17-839-202](https://doi.org/10.5194/amt-17-839-202)

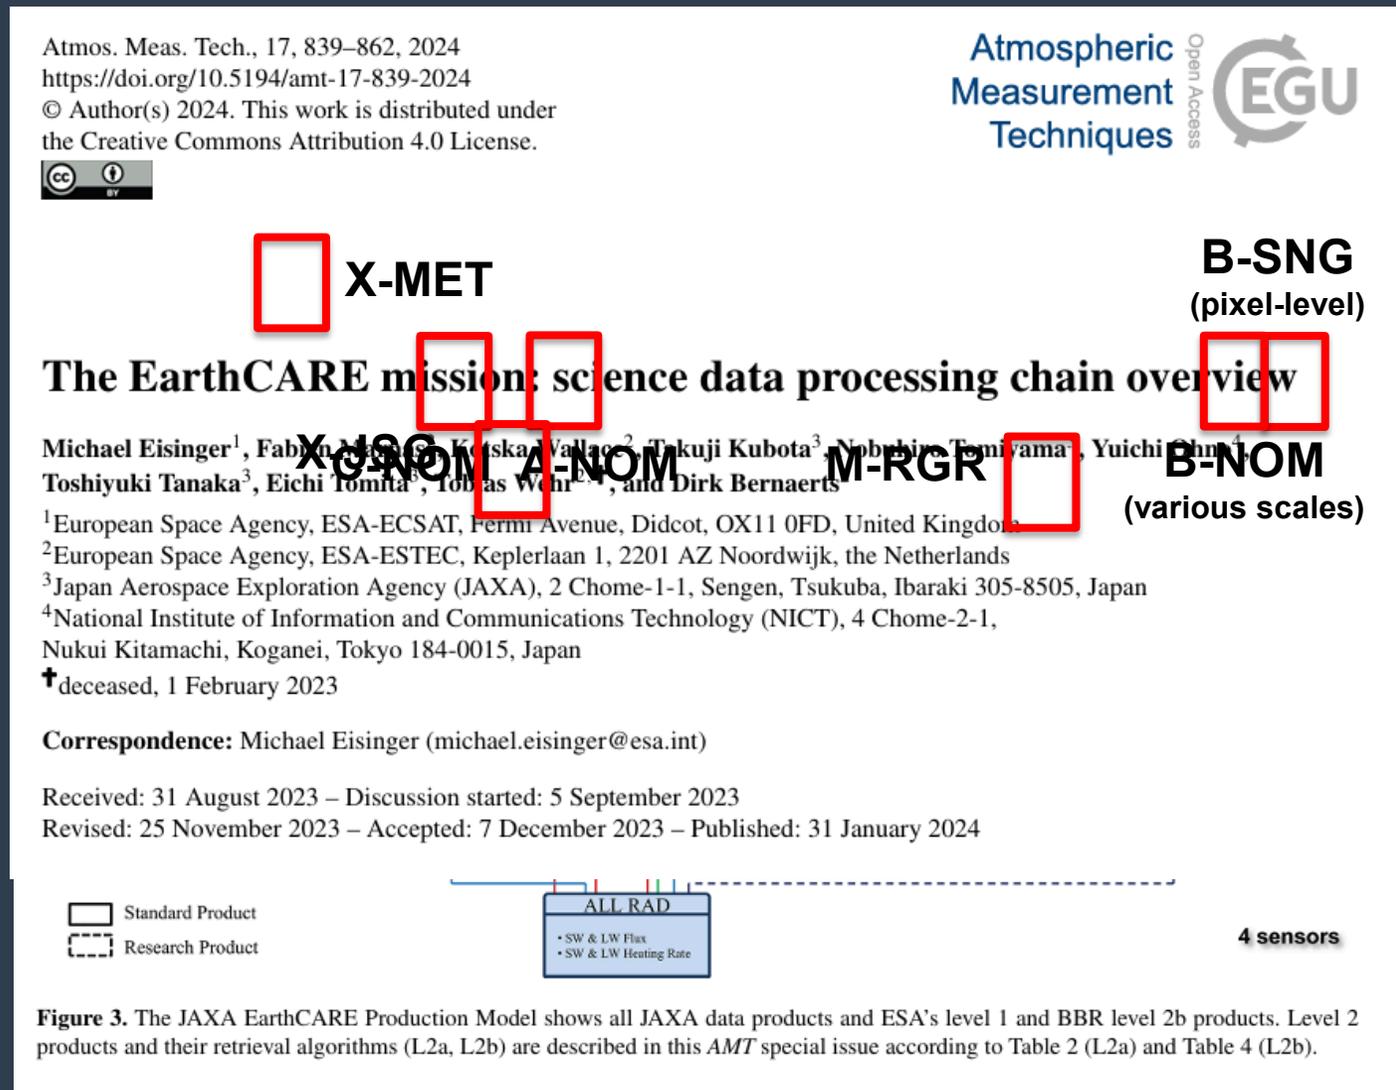

- Product naming convention:

[INSTRUMENTS]-[NAME]

- C-NOM (CPR Nominal, L1)
  - A-EBD (ATLID Extinction, Backscatter & Depolarization ratio, L2a)
  - ACM-RT (ATLID-CPR-MSI Radiative Transfer, L2b)
- L1 products are common to ESA & JAXA:
    - JAXA: CPR L1 product
    - ESA: ATLID, MSI and BBR L1 products & auxiliary products

- ESA L2 products

- JAXA L2 products

# Selecting EarthCARE L2 data products

*What kind of data do you want?*

## Measurements

*Which instruments?*

## Detection & Classification

*What geometry?*

## Retrievals

*Of what?*

### CPR

CPR-only  
**C-NOM** (L1)  
**C-FMR** (Z, PIA)  
**C-CD** ( $V_D$ ,  $V_S$ )  
 w/ ATLID & MSI  
**ACM-CAP**

### ATLID

ATLID-only  
**A-NOM** (L1)  
**A-EBD**  
 w/ CPR & MSI  
**ACM-CAP**

### MSI

MSI-only  
**M-RGR**  
 w/ CPR & MSI  
**ACM-CAP**  
 (solar and TIR channels at nadir)

### Clouds & precipitation

Feature mask:  
**B-NOM**  
 (domain-  
 averaged)  
**ACM-COM**  
**B-SNG**  
 (pixel-level)  
**M-COP**  
**ACM-CAP**  
 Cloud top phase:  
**M-COP**  
 MSI & ATLID:  
**BM-RAD**  
**A-ALD**  
**BMA-FLX**  
**M-AOT**  
**AM-ACD**

### Clouds Profiling Clouds & aerosols

Passive: Feature mask:  
**M-COP** **A-FM** **M-COP & A-FM**  
 Lidar-only: **C-FMR + CAOT**  
**A-ICE** (ice cloud classification)  
 Radar-only: **A-TC\* + C-TC**  
**AC-TC** **A-EBD\***  
**C-CLD** Precipitation composite:  
**G-TC** **ACM-COM**  
**ACM-COM** **AC-TC** Synergistic:  
**ACM-CAP**  
 Synergistic: Aerosol classification:  
**ACM-CAR-TC**  
**AC-TC**

### Aerosols

Passive:  
**M-AOT**  
 Lidar-only:  
**A-EBD\***  
 Synergistic:  
**ACM-CAP**

### Radiation

Fluxes & heating rates:  
**ACM-RT**  
 Radiative closure:  
**ACMB-DF**

\*when using **A-TC** and **A-EBD** for aerosols, use variables with suffix `low_resolution`; these variables use the most along-track averaging to remove lidar noise

# EarthCARE datafile naming conventions

**ECA** **EXAE** **ATL** **NOM** **1B** **20250601T131853Z** **20250601T144838Z** **05735E**

mission (always ECA)

expanded product name of form

XXX\_YYY\_LL

production centre

(EX for ESA, JX for JAXA)

sensing start-time of form

YYYYMMDDTHHMMSSZ

processing time of form

YYYYMMDDTHHMMSSZ

orbit number

& frame

product baseline (starting from AA

minor increment→AB ; major increment→BA)

- All EarthCARE data are divided into 8 “frames” per orbit

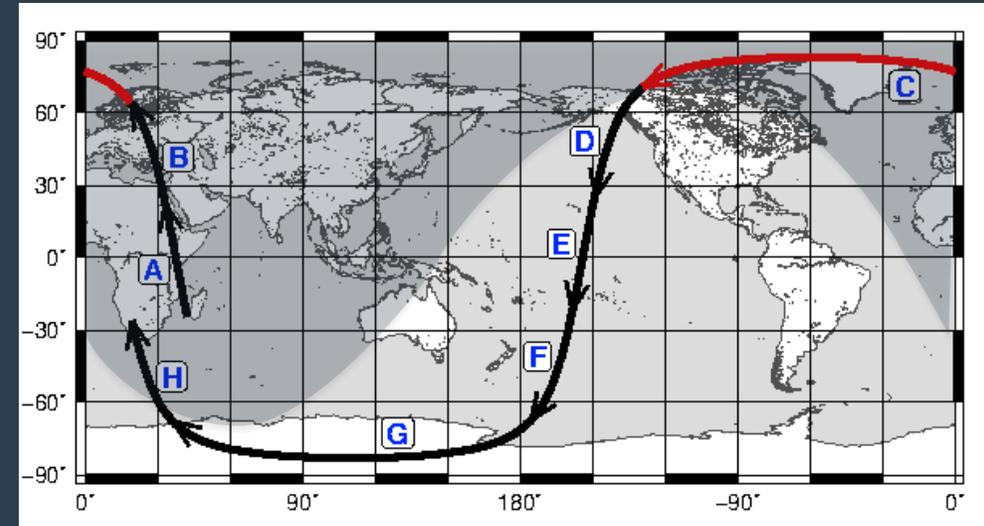

- Allows for very easy sub-sampling:

- A & E are always equatorial (night & day, respectively)
- C is boreal, G is austral
- B & H are night-time extratropics;  
D & F are day-time extratropics

- Sun-synchronous: A frames cross the equator around 02:00 local solar time;  
E frames cross the equator around 14:00 local solar time

- Each data product comprises

- a netCDF4/HDF5 file (\*.h5) containing the data (in the “ScienceData” group)
- an XML header file (\*.HDR) containing orbital/frame metadata, a list of inputs files & configuration settings

# Discovery, browsing and quicklooks

# Access and downloading

- ESA Online Access and Distribution System (OADS):
  - L1 products: [ec-pdgs-dissemination1.eo.esa.int/oads/](http://ec-pdgs-dissemination1.eo.esa.int/oads/)
  - L2 products: [ec-pdgs-dissemination2.eo.esa.int/oads/](http://ec-pdgs-dissemination2.eo.esa.int/oads/)
  - Searchable, or navigable by “tree”
- OADS-Download Python script:
  - [github.com/koenigleon/oads-download](https://github.com/koenigleon/oads-download)
  - Current download limit of 3000 products/day for most users
  - Relatively simple interface, but easy to add a shell script wrapper:

```
usage: oads_download [-h] [-d DATA_DIRECTORY] [-o [ORBIT_NUMBER ...]]
[-so START_ORBIT_NUMBER] [-eo END_ORBIT_NUMBER]
[-f [FRAME_ID ...]] [-oaf [ORBIT_AND_FRAME ...]]
[-soaf START_ORBIT_AND_FRAME] [-eoaf END_ORBIT_AND_FRAME]
[-t [TIME ...]] [-st START_TIME] [-et END_TIME]
[-r RADIUS_SEARCH RADIUS_SEARCH RADIUS_SEARCH]
[-pv PRODUCT_VERSION]
[-bbox BOUNDING_BOX BOUNDING_BOX BOUNDING_BOX BOUNDING_BOX]
[--overwrite] [--no_download] [--no_unzip] [--no_delete] [--no_subdirs]
[-c PATH_TO_CONFIG] [--debug] [--no_log]
[-i SELECT_FILE_AT_INDEX] [-V] [--export_results] [product_type ...]
```

## EarthCARE datafile structure and metadata conventions

- For all netCDF4/HDF5 files, the main scientific contents are found in the `ScienceData` group
- Each instrument has its own native resolution (at L1), but many products are available on the “Joint Standard Grid” (JSG), which combines the along-track grid of CPR and the vertical grid of ATLID:
  - CPR along-track grid with resolution ~1km (2 CPR profiles, 3 to 5 ATLID profiles)
  - ATLID vertical grid: resolution ~100m up to around 20km; ~500m from 20km to 40km
  - MSI horizontal resolution ~500m across 150km swath
- For co-aligning products on different grids, use spatial (lat/lon) coordinates rather than time: there can be differences in the time coordinates between instruments (e.g. 3s difference between ATLID and CPR due to slight off-nadir pointing of ATLID)
- Very high standard for variable naming, metadata description, etc., **but let us (L2 developers) know if something could be better described**

# Basic I/O

- Python module “ectools”:  
[bitbucket.org/smason/ectools](http://bitbucket.org/smason/ectools)
- Open to contributions (just ask to be added); currently widely used among L2 developers, ESA, and cal/val teams.
- Product-specific loading functions using xarray:
  - `ecio.load_AEBD(path_to_file)`
  - use wildcards to select from among multiple files
- NOTE: each product will over-run the edges of the frame boundary, but by different amounts, so you can't rely on the `along_track` dimensions to be consistent between products

```
[30]: ecio.load_ACTC("/perm/pasm/DISC/data/L2b/AC__TC__2B", product_baseline="A[B-Z]",
                  frame_code="05*[A-H]", nested_directory_structure=True)

13 EarthCARE product files match path /perm/pasm/DISC/data/L2b/AC__TC__2B/***/ECA_EXA[B-Z]_AC__TC__2B*_*_05*[A-H]/ECA_EXA[B-Z]_AC__TC__2B*_*_05*[A-H].h5; selecting -1
Selecting frame from 99 to 5044

[30]: xarray.Dataset

Dimensions:          (along_track: 4945, JSG_height: 242)

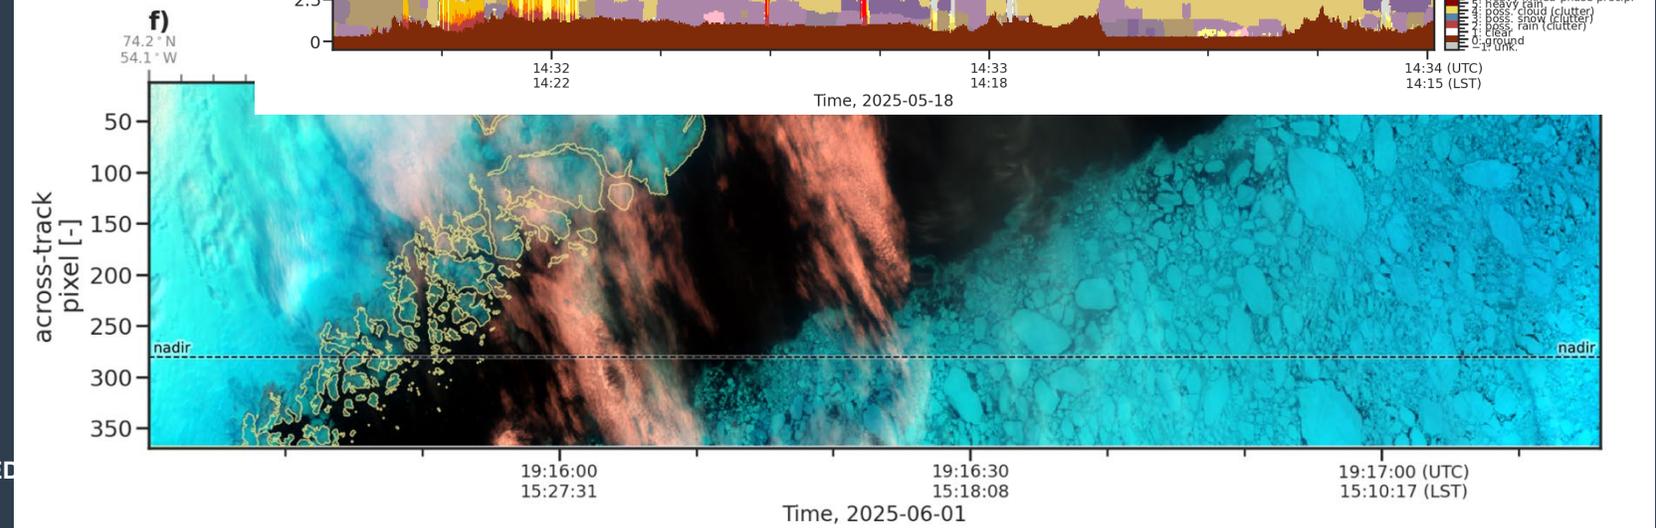

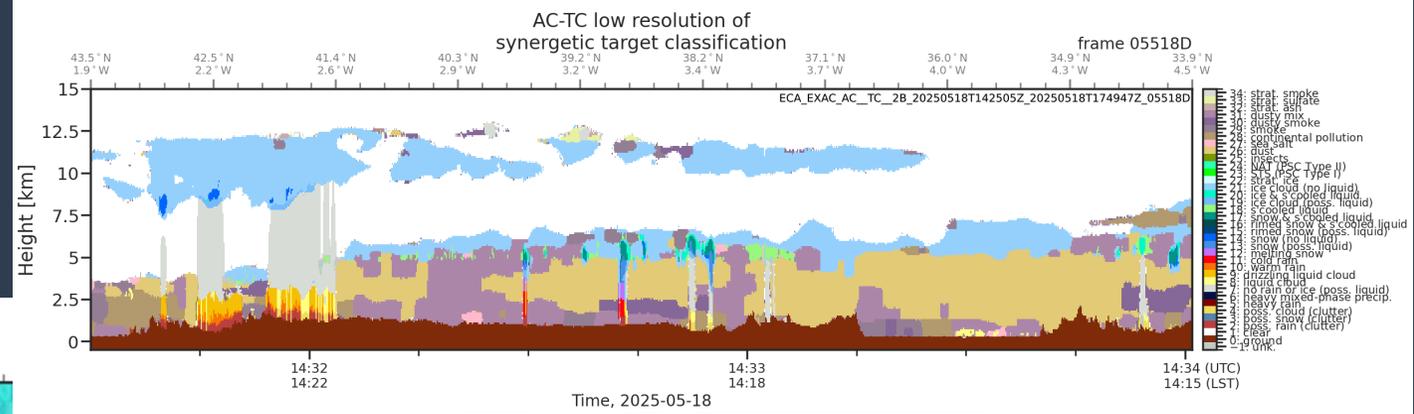

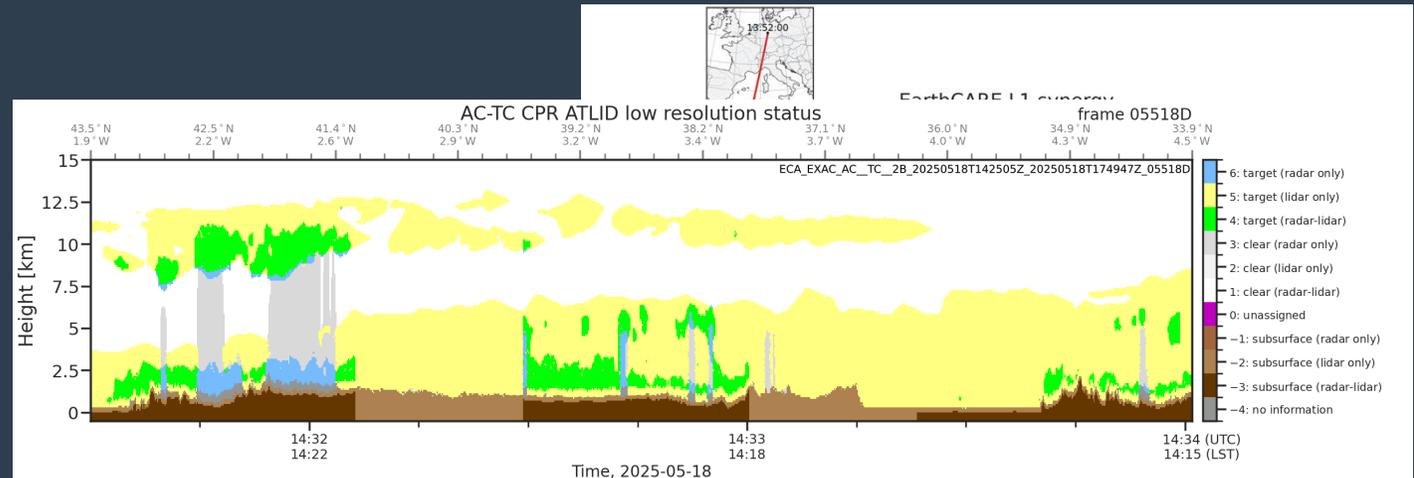

Coordinates:
  along_track      (along_track)          int64  99 100 101 102 ... 5041 5042 5043

Data variables:
  time              (along_track)         datetime64[ns] ...
  latitude          (along_track)         float64  22.5 22.51 22.52 ... 67.48 67.49
  longitude         (along_track)         float64 ...
  geoid_offset      (along_track)         float64 ...

  ATLID_target_cl... (along_track, JSG_height) int8 ...
  ATLID_target_cl... (along_track, JSG_height) int8 ...
```

# Plotting with ectools

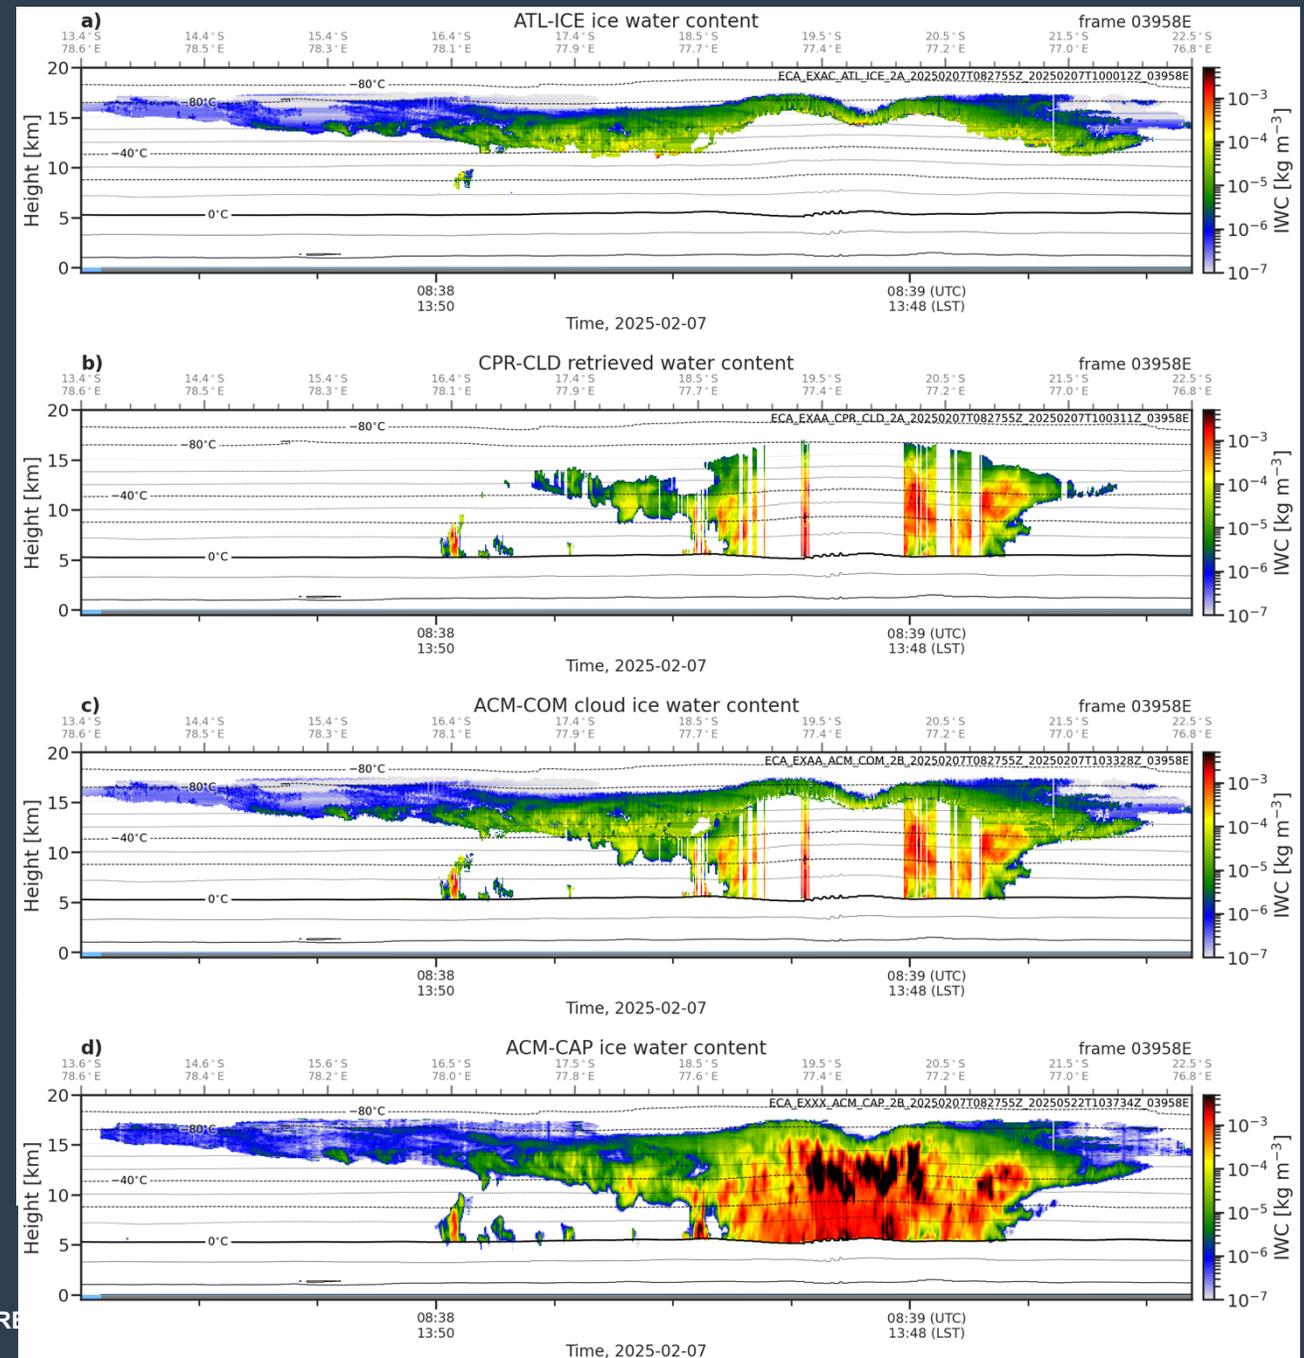

- Consistent publication-quality aesthetic across 1D, 2D, curtain & across-swath images.
- Synergistic quicklooks: `ecplt.quicklook_ACM( )`
  - Easy to configure to "zoom in" on features of interest
- MSI "natural colour" images (RGB: SWIR-NIR-VIS) provide a powerful visual context for case studies
- Classification/quality status plots

```
[11]: [15]: ecplt.quicklook_ACM("05751D", time_lims=('2025-06-02 13:52:00', '2025-06-02 13:57:00'), show_polar_channel=True, hmax_ANOM=20e3, hmax_CNOM=20e3, ANOM_smoother=('along_track':5), overwrite_figure_height=45)
```

## Some example use-cases

- Comparing multiple products/variables to gain additional insights
- Intercomparison of retrieved quantities from different products (e.g. A-ICE, C-CLD, ACM-COM & ACM-CAP)
- `get_XMET( )` lets you extract meteorological information from X-MET (the ECMWF forecast) onto the grid of any L2 product
  - Overlay plot with other information (temperature contours)
  - Comparison of retrievals against model cloud fields

## EarthCARE is just getting started

- First L2 data released in March; synergistic retrievals and radiative closure assessment products still to be released in Q4 this year.
  - We've improved our products and processors a lot based on in-flight data and in coordination with calibration/validation campaigns
  - Also need to improve in response to exposure to scientific use:
    - So much redundancy between products and similarly-named variables—very easy to just use the first product or variable you come across and not investigate further. **We need to help with this.**
- What we're working on:
  - Product selection guides to match specific user needs to L2 products
  - Providing “cheat sheets” for L2 products to better describe caveats/pitfalls/best use of our data
- **Any feedback on products, documentation or tools are very welcome**
